

Digital IC-Project and Verification

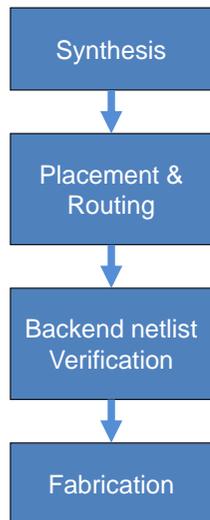

Place and Route

Deepak Dasalukunte

Outline

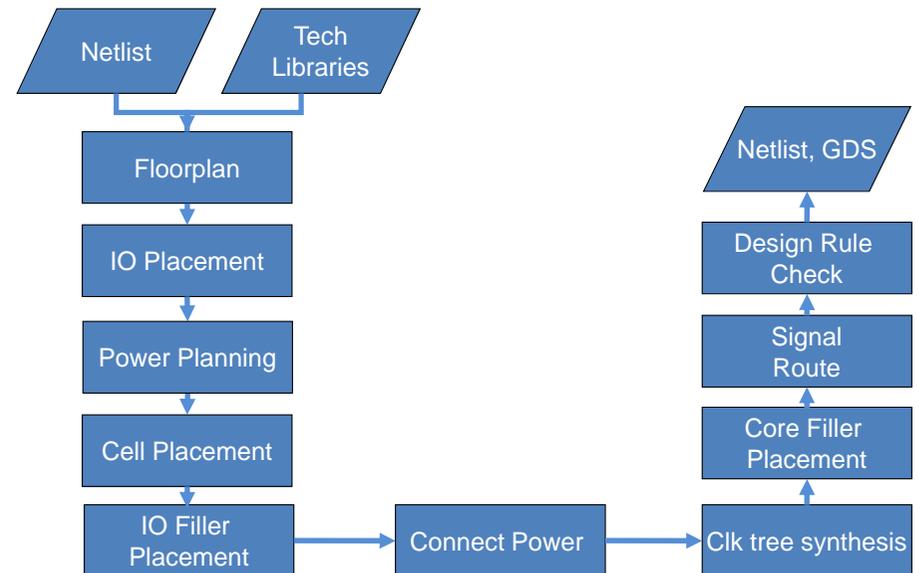

- Backend ASIC Design flow
 - General steps
- Input files
- Floorplanning
- Placement
- Clock-synthesis
- Routing

Typical Backend Design Flow

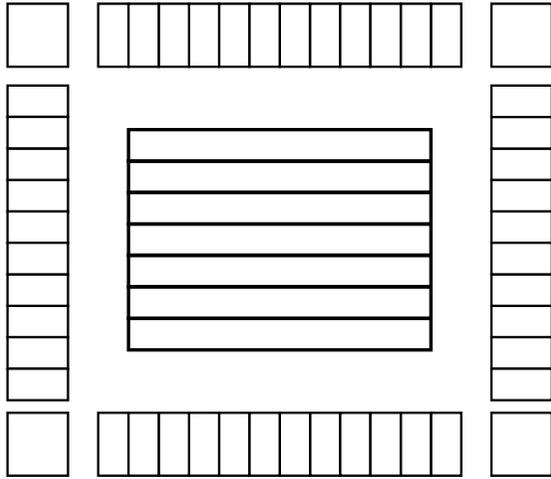

- Synthesis:
 - Synopsys Design Compiler (Design Vision)
- Placement:
 - SoC Encounter
- Backend netlist Verification
 - Modelsim
- Fabrication
 - ASIC vendor

SoC Encounter Flow

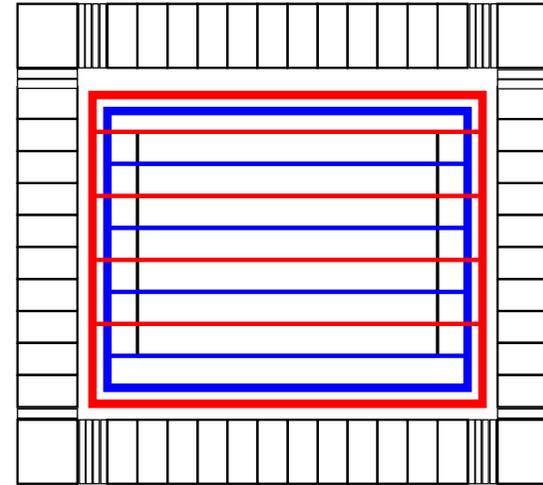

SoC Encounter Flow

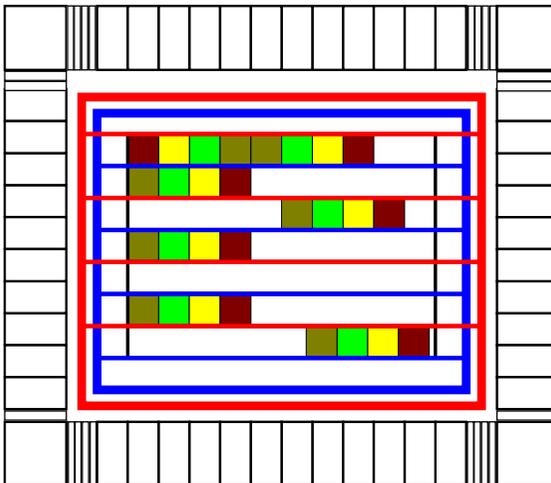

- Floorplan:
 - Placement area
 - IOs
 - RAM/ROM

SoC Encounter Flow

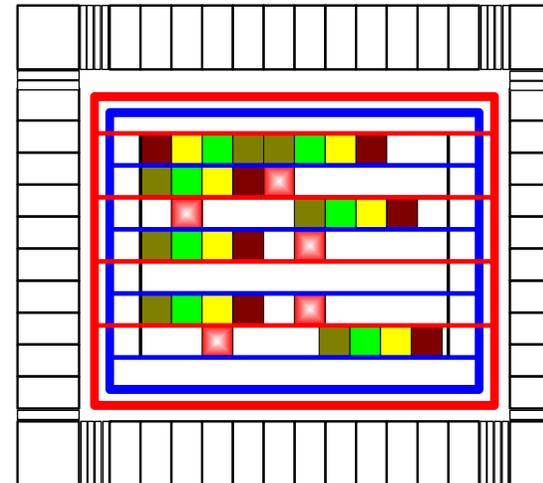

- Power Planning
 - Design a power ring
 - Add horizontal and vertical power stripes

SoC Encounter Flow

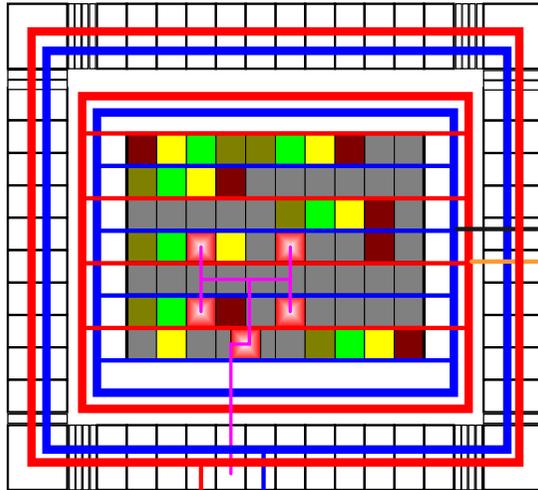

- Place Cells:
 - Place all the standard cells into the rows

SoC Encounter Flow

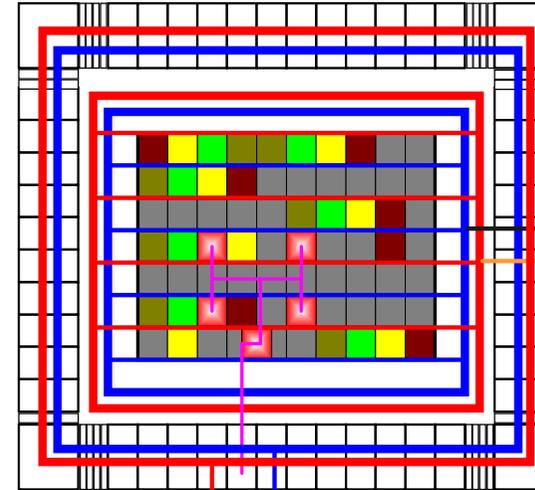

- Clock Tree Synthesis:
 - Places clock buffers
 - Timing constraints
 - Skew etc

SoC Encounter Flow

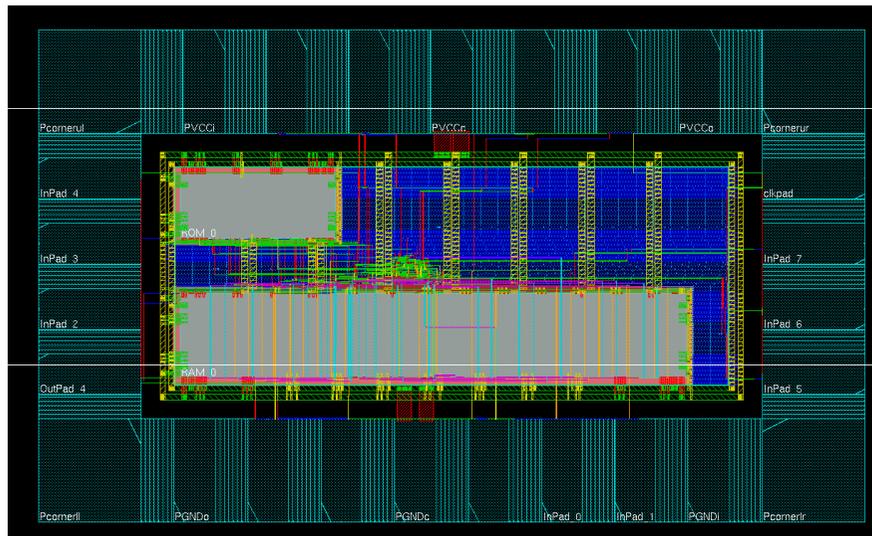

- Connect Power Supply:
 - Core Power
 - Pad Power
- Add FILLER cells
 - core filler cells
 - IO filler cells

SoC Encounter Flow

- Route Clock tree:
 - Finds an “optimal” way
 - Reduces skew
- Route signal nets
 - Final step

Demo Layout

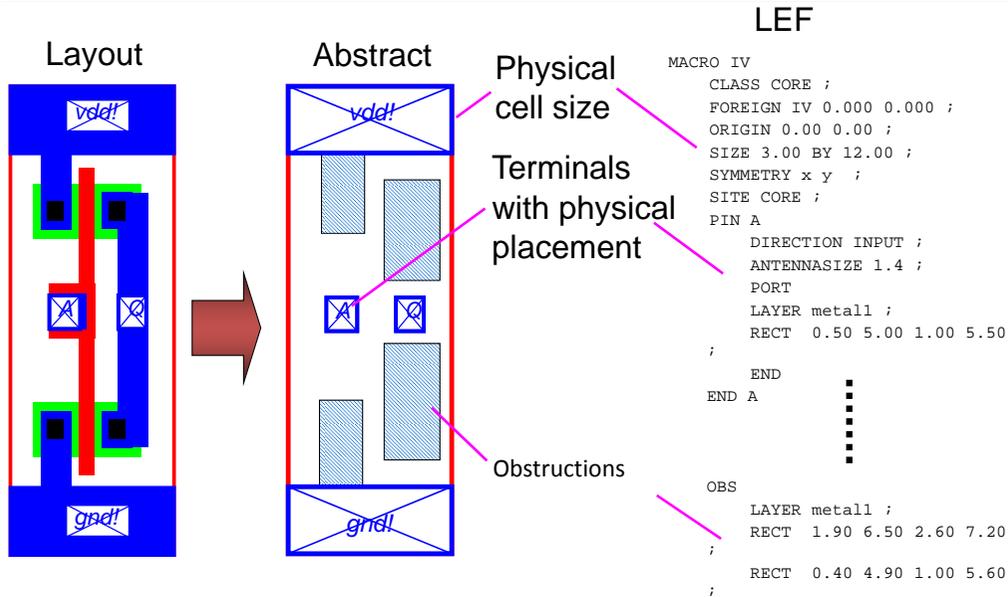

Technology Description Files

LEF: Library Exchange Format

- Technology: Design rules, Capacitance, Resistance, Antenna factor, Vias
 - header.lef
- Cells & pads: Size, Class, Placement, Pin Information, Obstructions.
 - Standard_cell.lef
 - IO.lef

LEF-Example: Inverter

Deepak Dasalukunte, EIT, LTH, Digital IC project and Verification

Place and Route

Design Description Files

Enc: Encounter Format

- Netlist, Layout

DEF: Design Exchange Format (not used in our flow.)

- Netlist, Layout

Verilog

- Netlist, generated from synthesis tool

Deepak Dasalukunte, EIT, LTH, Digital IC project and Verification

Place and Route

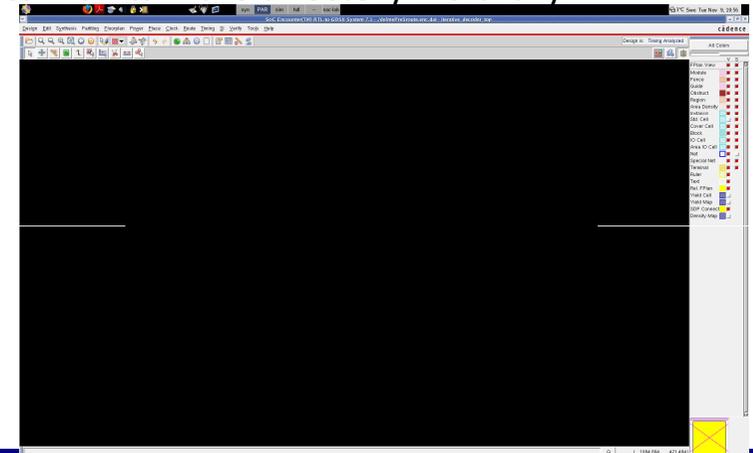

Required Data for PnR (Faraday 130nm)

- LEF: Library Exchange Format
 - header.lef
 - standardCell.lef : Cell Library
 - IO.lef : Pad Library
 - memory.lef : custom
- lib/tlf: libraries that contain timing information
- sdc: Synopsys Design Constraint (generated during synthesis). Optional
- Memory: memory.lib
- Design (netlist): your_design.v

Starting the SoC Encounter

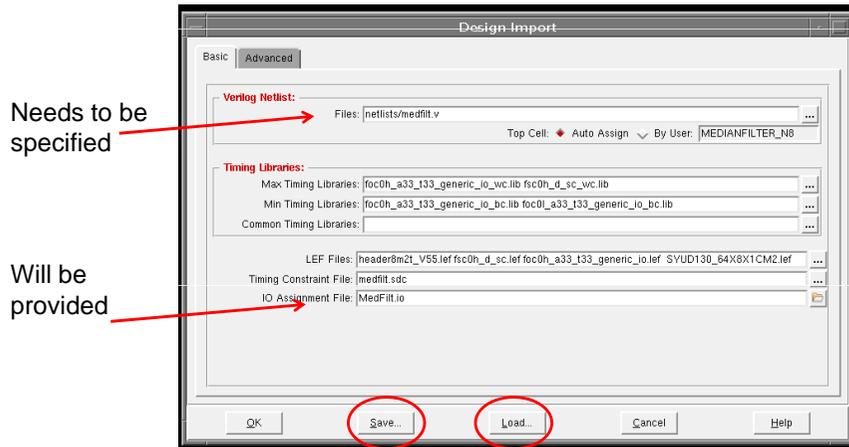

inittde dicp10 encounter

Remember to maintain the directory hierarchy.

Design Import

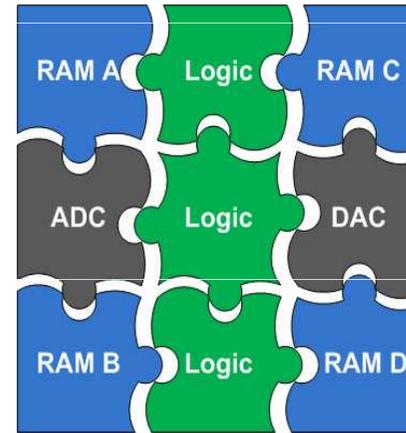

Design -> Import Design

2

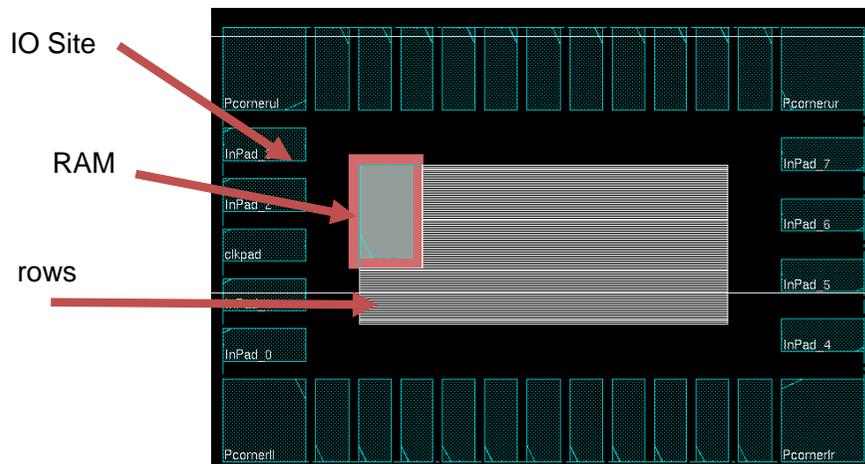

1

Floorplan

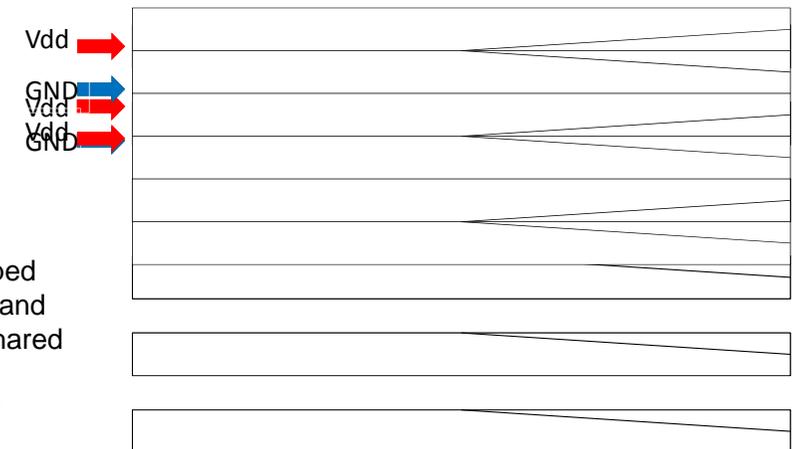

- A starting floorplan is created (required area is estimated by the tool)
- Global and detailed routing grids are created
- The core rows are created
- Sites for IOs are created
 - IO and block to core distance is defined by the user

Floorplanning

Core Rows

If rows are flipped and abut VDD and GND can be shared by 2 rows.
Default setting!

Floorplan Setup

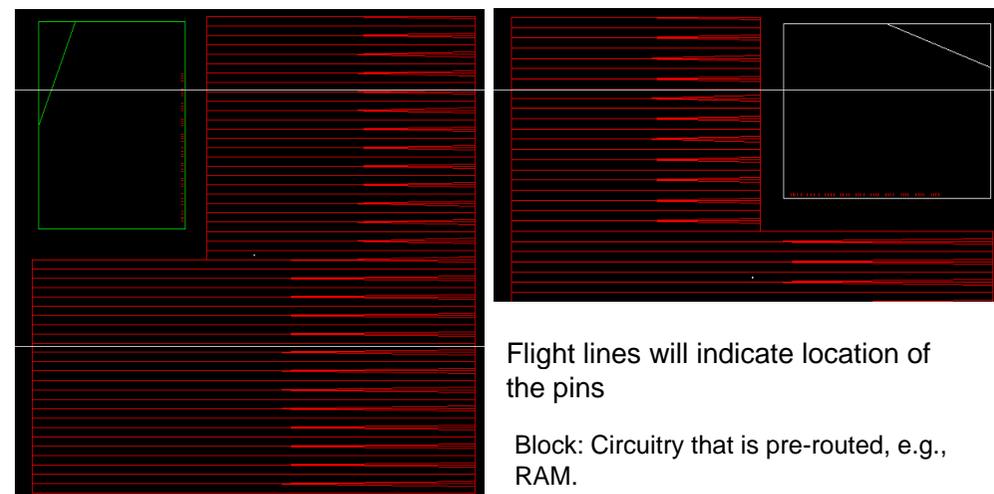

Floorplan -> Specify Floorplan

Deepak Dasalukunte, EIT, LTH, Digital IC project and Verification

Place and Route

Block Placement

Flight lines will indicate location of the pins

Block: Circuitry that is pre-routed, e.g., RAM.

Deepak Dasalukunte, EIT, LTH, Digital IC project and Verification

Place and Route

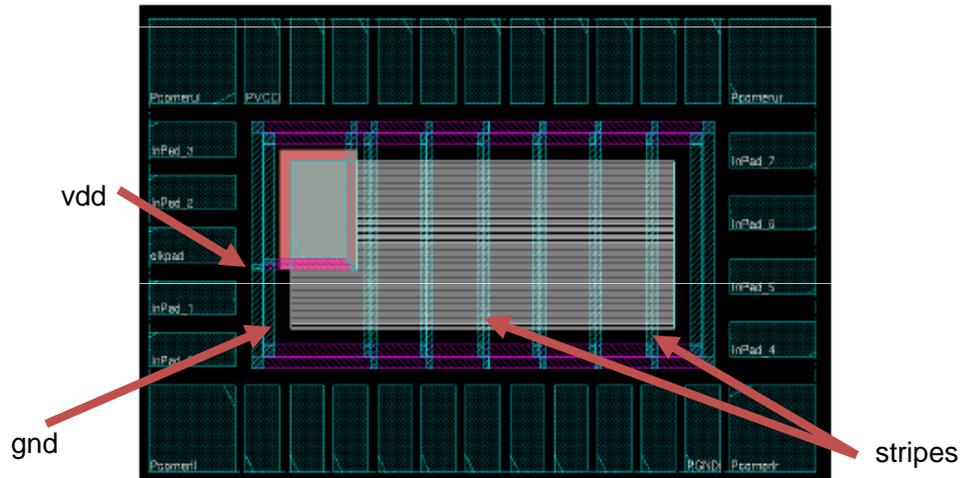

IO Placement

- Specify location/orientation of pads
 - Input, output
 - core-power, pad-power
- Recommendation:
- Put core power supply on *top or bottom*
- Use gaps in the pad frame for additional power supply.
- !No CORE power supply at the corners!
- The more supplies the better

Power Rings

- Power paths are planned and modified before routing
- Creation of power rings that surround all blocks and core
- Creation of stripes over rows
- Connects rings, stripes and pads

Power Rings cont'd

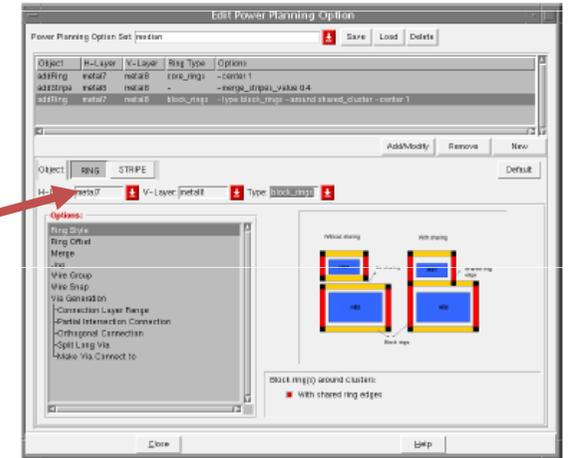

Power Ring Setup

Power-> Power planning -> Add Rings

Power-> Power planning -> Add Stripes

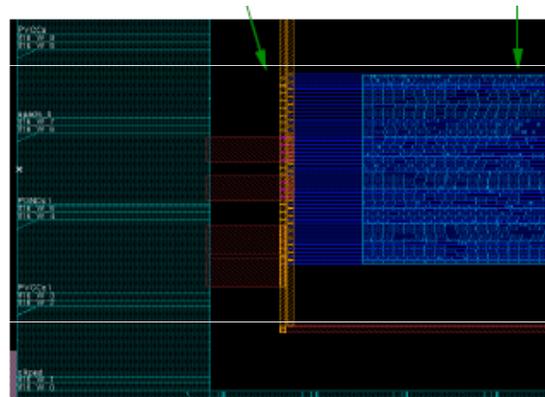

Choose upper layers
(say metal 3 or 4)

Connecting Power (sRoute)

between

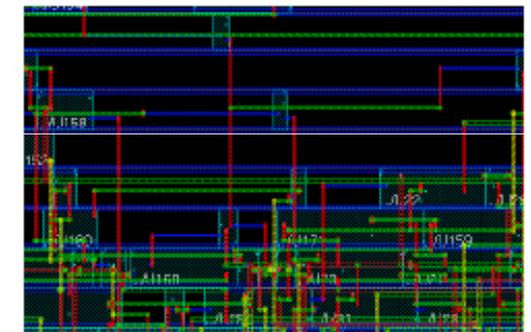

- IO power pins within IO rows
- CORE ring wires and the IO power pins
- stripes and core rings
- block power pins and the CORE ring wires

Route-> Special Route

Cell Placement

- Initial cell placement
- Moves, swaps changes orientation of cells to minimize required wire length
- Optimizes for wire length and net crossings
- A post CTS optimization may be carried out to optimize the design

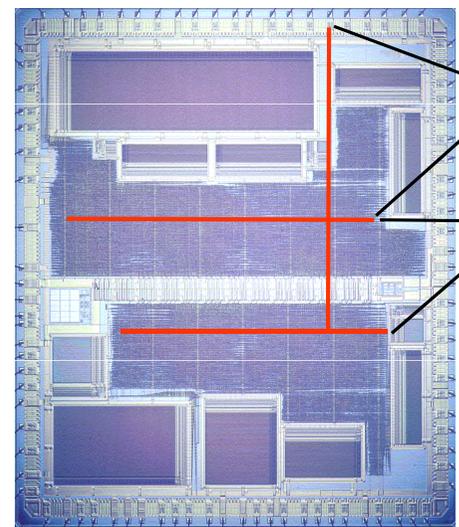

Place -> Standard Cells

Clock Tree Synthesis

- Clockpad and output need to be defined in a specification file.
 - clockpad/O
- Clock tree is synthesized and routed with highest priority to minimize clock skew.

Clock Skew

Absolute Skew

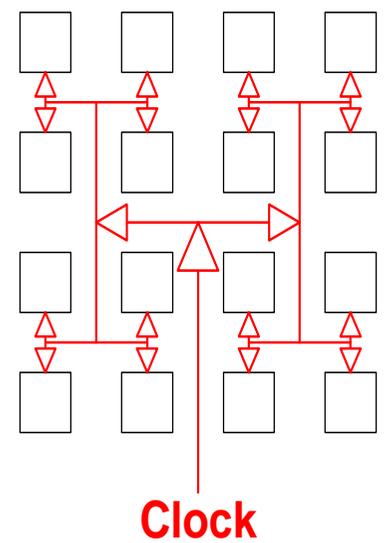

-Delay from input to leaf cell

Relative Skew

-Delay difference between leaf cells

Danger!
Too much clock skew may:
1) Force you to reduce clock rate
2) Cause malfunction at any clock rate

Distributed Buffers in H-tree

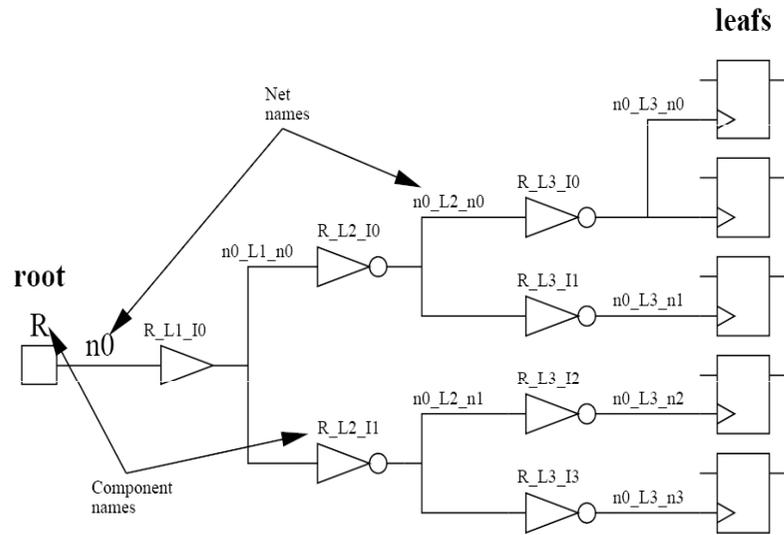

Small relative skew

Absolute skew of less importance

CTS commands

- `create_clock -period value -name clk_name -add [get_ports clk]`
- Generate Clock tree specification
`createClockTreeSpec -output file_name.ctstch -routeClknet -buffer buffer_list`
- Specify CTS file and synthesize clock tree.
`specifyClockTree -clkfile file_name.ctstch`
`clockDesign -specFile file_name.ctstch -clk clk_name`
`deleteTrialRoute`

Synthesized Clock tree

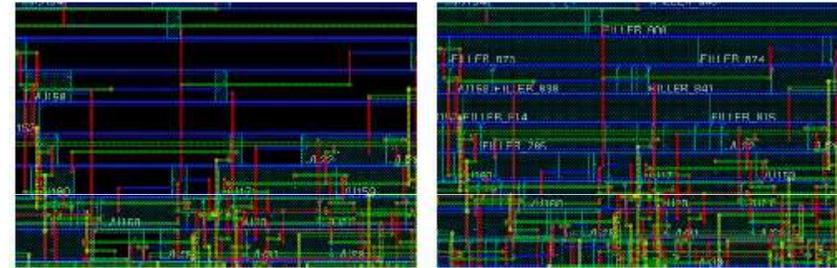

Clock buffers are placed in the core row gaps

Core filler cell

Core filler cells ensure the continuity of power/ground rails and N+/P+ wells in the row.

Filler cells will close any gap it is important to perform CTS before filler cell placement.

before

after

Place -> Filler -> Add filler

Place -> Filler -> Add IO filler

Signal Routing

- Signal routing
 - Connects cells according to netlist
 - Metal wires are connected over several layers
- Routing time is strongly dependent on the design complexity

Route -> Nano Route

Verification and Tapeout

Verification (in SoCEnc)

- Connectivity, Antenna

Export

- Verilog (netlist)
 - sdf (timing)
 - GDS II
- } Post-layout simulation
- } tapeout

Verify

Routing Script

- Each command is automatically written in a script file **encounter.cmd**
- Script needs to be trimmed (remove unnecessary commands)
- Easy to change parameters
- Can be reused with modifications
- Time to do PnR iteratively is reduced
- Serves as documentation and makes it possible to repeat the flow
